switching center [(16)] by means of the mobile services switching center (MSC) device control protocol.

Shap sping

31. (Amended) Method of claim 30, wherein after receiving the media gateway address information from the media gateway [(10)] the media gateway address information is forwarded from the mobile services switching center [(16)] via the base station controller [(14)] to the base transceiver station [(8)] for establishing a through-connection between the media gateway [(10)] and the base transceiver station [(8)] on the basis of the BTS information and the media gateway address information in order to permit direct exchange of information between the media gateway [(10)] and the base transceiver station [(8)] and vice versa.

In the Abstract

[The present invention relates to a]Communication network and a corresponding method are disclosed for operating the communication network that has a packet switched protocol based cellular telephone network [(1)] comprising a first layer [(3)] for transferring signalling information assigned to a telephone call being processed by the communication network, a second layer [(4)] for transferring payload information assigned to the telephone call and an interface [means (20)] for coupling the cellular telephone network [(1)] to a further network [(2)], the interface [means (20)] comprising a signalling information exchange function between the cellular telephone network [(1)] and the further network [(2)] and a payload information exchange function between the cellular telephone network [(1)] and the further network [(2)], the first layer [(3)] and the second layer [(4)] of the cellular telephone network [(1)] being coupled to the interface [means (20)], wherein the second layer [(4)] of the cellular telephone network [(1)] transfers the payload information of the telephone call to and from the interface [means (20)] on a direct route [(11)] assigned to the telephone call within the second layer [(4)].
